Introduction

The NZ Transport Agency (NZTA) is a Crown entity responsible for, among other things, managing 10,894 kilometres of state highways. The state highway system accounts for about 12 percent of New Zealand's roads and around half of the 40 billion vehicle kilometres New Zealanders travel each year¹. Motor vehicles travelling on roads emit an array of air pollutants which can contribute to harmful effects on human health and smog formation.

In its Environmental Plan², NZTA is committed to being socially and environmentally responsible and improving the contribution of state highways to the environmental and social well being of New Zealand. The specific objectives that NZTA has for improving air quality include:

- A1. Understand the contribution of vehicle traffic to air quality
- A2. Ensure new state highway projects do not directly cause national environmental standards for ambient air quality to be exceeded
- A3. Contribute to reducing emissions where the state highway network is a significant source of exceedances of national ambient air quality standards

Annual assessment of vehicle emissions from the state highway network is undertaken using data gathered from selected sites using passive samplers to measure nitrogen dioxide (NO_2) as a general proxy for air pollution from motor vehicles. The World Health Organisation (WHO) states³ that:

"Nitrogen dioxide concentrations closely follow vehicle emissions in many situations, so nitrogen dioxide levels are generally a reasonable marker of exposure to traffic-related emissions."

In 2007, NZTA started a national NO_2 passive monitoring programme to determine relative levels of vehicle pollution across the state highway network. As at the end of 2010, diffusion tubes (a type of passive sampler) have now been deployed in 128 sites across New Zealand (including state highway, local road and background locations). The overall aim is to see a decreasing trend in NO_2 concentrations measured at these sites.

This report presents the metadata for all sites (past and current) that have been part of the NZTA national NO_2 passive monitoring network from 2007 to 2010 and includes the following areas:

- Summary tables listing all sites ordered by monitoring zone from 2007 to 2010
- Maps showing the coverage of the national network in 2007, 2008, 2009 and 2010
- Individual one-page descriptions for each site ordered by monitoring zone outlining critical details such as location, type and the distance to nearest roads/receptors

NZTA has recently produced its first report on the passive sampling results covering 2007 to 2009⁴ and intends to report on the results annually in future.

¹ MoT (2010). *The New Zealand Vehicle Fleet, Annual Fleet Statistics 2009*, Ministry of Transport, September 2010

² Transit (2008). *Environmental Plan, Version 2*, Transit New Zealand, June 2008. Note: Transit New Zealand merged with Land Transport New Zealand to form the NZ Transport Agency on 1 August 2008

³ WHO (2006). *Air Quality Guidelines Global Update 2005:Particulate Matter, Ozone, Nitrogen Dioxide, and Sulphur Dioxide*, World Health Organisation, October 2006

⁴ NZTA (2011). *Ambient Air Quality (Nitrogen Dioxide) Monitoring Network Report 2007-2009*, NZ Transport Agency, March 2011

Monitoring Zones

NZTA monitoring zones have been established for each main urban area⁵ in New Zealand, as well as for Otaki, Blenheim, Greymouth and Queenstown. The number of monitoring sites within each zone reflects the risk of being exposed to elevated levels of air pollution arising from vehicles using the state highway network. This is based on the population of urban areas in each zone.

In 2007 and 2008, there were 52 locations monitored throughout New Zealand. NZTA expanded the network in 2009 to include background and local road locations, with a total of 83 locations. The network was further expanded in 2010 to include more local road and background monitoring sites and now numbers 128 sites. The number of monitoring sites in each zone is shown in Table 1.

Table 1: The number of monitoring sites in each zone from 2007 to 2010

Monitoring zone	Population in 2006 (000's)	Site type	Number of sites

⁵The NZTA monitoring zones reflect the “urban areas” used by Statistics New Zealand. The urban area classification is designed to identify concentrated urban or semi-urban settlements without the distortions of administrative boundaries. Three types of urban areas are defined – main, secondary and minor – and these are delineated by population. See www.stats.govt.nz/census/about-2006-census/2006-census-definitions-questionnaires/definitions/geographic.aspx for details.

Monitoring sites in the NZTA national NO₂ passive monitoring network are classified as:

- *State highway* sites, which are located within 100m of the highway being monitored
- *Local* road sites, which are located within 50m of the road being monitored
- Urban *background* sites, which are located more than 100m from a state highway and more than 50m from a busy local road

Monitoring Locations

Table 2 summarises the metadata for all sites that were operational between 2007 and 2010. Figures 1 to 4 illustrate how the monitoring network has developed from 2007 to 2010.

Table 2: Summary of metadata for the NZTA national ambient NO₂ monitoring network for sites for 2007 to 2010
